ABSTRACT

This preliminary model deals with manpower requirements to 1980 and jobs for University of Georgia graduates. Emphasis is placed on suggested methodology for dealing with a projected output of graduates in terms of speciality fields and the correlation of this projected output with projected manpower requirements in the related speciality fields. The requirements and outputs are listed for the University of Georgia each year both in Georgia and in the U.S. to 1980. A 29-item bibliography and appendices of related material are included. Date: January, 1973 Number of Pages: 91

Abstract:

This report is a preliminary model and suggested methodology for dealing with the projected output of graduates in terms of speciality fields and the correlation of this projected output with projected manpower requirements in the related speciality fields. The requirements and outputs are listed for the University of Georgia each year both in Georgia and in the United States to 1980.

MANPOWER REQUIREMENTS REPORT TO 1980;

JOBS FOR UNIVERSITY OF GEORGIA

GRADUATES IN GEORGIA AND THE NATION

January 1973

PREFACE

In restructuring and integrating existing University of Georgia budgetary and planning procedures into a Planning, Programming, Budgeting System (PPBS), it is important to focus attention on outputs and their evaluation. This orientation is important for all users of the PPB System and criteria must be formulated for measuring and evaluating program output. One aspect of the problem is examined here.

This report is the third in a series being produced by the Office of Program Planning and Analysis. The three reports in the series should not be considered as monographs on important subjects, but rather parts of our input into the planning system structure of the PPB System being implemented at the University of Georgia and supported by the Ford Foundation.

The objective of the report series is to suggest a number of approaches to the difficult problem of identifying and measuring higher education output. As such they should be considered initial studies to be periodically updated and revised and the results made available for the decision making process at all levels of the University.

The first report, entitled Measuring One University Output A Survey of Undergraduate Degree Holders of the University of Georgia From the Classes of 1960-1970 considered one aspect of the problem. There are really two sets of objectives in an instructional program, those of the institution and those of the student. The ideal situation would be complete agreement between the sets of objectives. Unfortunately, they do not always coincide. All too frequently those in higher education fail to measure program performance from the standpoint of the student's objectives. The first study, therefore, suggested one means of approaching this situation.

The second study entitled A Study of the Ph.D. Graduates of the University of Georgia 1966-1970 dealt with the effectiveness of graduate education at the University of Georgia. Concentration was on the opinions of the graduates regarding the effectiveness of their graduate training. This study reflected another approach to measuring program output and performance.

The third study in the series, reported on here, has a somewhat different orientation. In formulating the Modus Operandi to prepare for the development and implementation stages of

the PPBS Project the Project Director has stated, that "we will, by the careful selection and use of known analytical methods . . . probe into . . . historical, economic, and socio-political factors existing in Georgia and effecting institutions of higher learning, . . . general manpower studies concentrating on the type, quantity and quality of needed higher education."

Specifically this Manpower Requirements Report looks, first, at the impact of University of Georgia graduates on the manpower supply of Georgia, and secondly, at the projected manpower requirements to 1980. Thus, this report focuses on output requirements which should have an impact on the formulation of output objectives for specific instructional programs in the University of Georgia.

Manpower studies by necessity use statistical data of the past, projections are based on conjecture using variables of doubtful stability. The freshmen entering the institution will be available for the labor market at best in four years and the Ph.D. in eight years. This study will, therefore, be an effort to establish a methodology and only succeeding studies will give sufficient historical information to become viable instruments for indicating reliable trends for decision-making.

The criteria for this study were outlined by the Project Director in May 1971 and the Project Team was briefed as to the form the study should take. Lin Tisdell and Dong Kun Kim did the initial research of statistical material and relevant literature. Joseph B. Waters supervised and participated in assembling the study and presented a preliminary and unpublished paper entitled "Manpower Study: An Analysis of Job Openings in Georgia and The Nation for College Graduates by Major Fields 1975-1980." This preliminary effort established an acceptable methodology. The Project Director, after reviewing both the preliminary paper and the existing literature, decided further study should be made using also more up-to-date data. Joseph S. Lechowicz, who had assisted in compiling the preliminary paper, was thus commissioned, under the supervision of the Associate Director, to present the newly conceptualized, researched, and much expanded study. The major credit for this current study must, therefore, go to him.

Reports in this series on institutional outputs to-date have focused on outputs of instructional programs (degree-majors). Future Studies might well deal with outputs of public service and research programs.

INTRODUCTION

This report is one of a series being produced by the University of Georgia, Office of Program Planning and Analysis, which focuses on the problem of identifying and measuring institutional output. Specifically, this report deals with projected output of graduates in terms of specialty fields and the correlation of this projected output with projected manpower requirements in related specialty fields. In other words, this study has developed information on the future supply and demand of college trained manpower; it is not a study of the impact of University of Georgia graduates on the economy of the state.

This report is seen as an example of one type of input needed by the program planner in formulating program output objectives. A program can be relevant to society only if its output objectives match requirements in society.

The personnel who prepared this report do not profess to be manpower specialists. They have not attempted to uncover new data but have used the most recent and reputable data available and reorganized it in a form more useful to administrators, instructors and counselors. The Project Team took available data of The U. S. Labor Department, The Department of Health, Education, and Welfare, The Georgia Department of Labor, and the Georgia Board of Regents and formatted it for their specific purpose. All the projections used were developed after the 1970 national census.

Although the projections and basic data were taken from available reports, a number of decisions had to be made by the Project Team. Some of the more critical decisions are as follows:

- (1) The occupations relevant to University of Georgia graduates and selected for this study.
- (2) The major fields in the University and their relationship to the selected occupations -- a matching process.
- (3) The appropriate data series to be projected to 1980.

Decisions were made with great care. Relevant literature was researched. In individual cases academic advisors and the Chief, Manpower Resources, State of Georgia, were consulted. The procedure and rationale in making decisions are outlined in detail in the section dealing with Methodology.

Finally, these manpower projections in the University of Georgia study have been made within the framework of the assumptions underlying the State¹ and the National² projections to 1980. They are the following:

- (1) *The international climate* will improve. The United States will no longer be fighting a war, but, on the other hand, a still guarded relationship between the major powers will permit no major reductions in armaments. This would still permit some reduction from the peak levels of defense expenditures during the Vietnam conflict.
- (2) *Armed Forces strength* will drop back to about the same level that prevailed in the pre-Vietnam escalation period.
- (3) *The institutional framework of the American economy* will not change radically.
- (4) *Economic, social, technological, and scientific trends* will continue, including values placed on work, education, income, and leisure.
- (5) *Fiscal and monetary policies* will achieve a satisfactory balance between low unemployment rates and relative price stability without reducing the long-term economic growth rate.
- (6) *All levels of government* will join efforts to meet a wide variety of domestic requirements, but Congress will channel more funds to state and local governments.
- (7) *Efforts to solve the problems posed by air and water pollution and solid waste disposal*, although they may preempt an increasing amount of the Nation's productive resources, will not lead to a significant dampening of our longrun potential rate of growth.
- (8) *Fertility rates* will be lower than they have been in the recent past.

This report is meant to be an example of the type of study needed on a continuing basis as input to the planning process particularly at the college and department level. The use of manpower specialists might well improve the level of sophistication and quality of future studies.

²U.S. Department of Labor, Bureau of Labor Statistics, *Occupational Manpower Training Needs*, Bulletin No. 1701, (Washington: U.S. Government Printing Office, 1971), p. 67.

GROWTH IN NUMBER OF GRADUATES

The University of Georgia has increased its number of graduates from 2,507 in 1964 to 6,018 in 1972. In 1980 the University is expected to be graduating 9,296 students. These projections are based on projected U. S. college enrollment reflecting a moderate increase (C2).³

The University System in Georgia had conferred 5,739 degrees in 1964-1965. By 1972-1973, the System is expected to confer degrees to 17,266 students. By 1979-1980 the degrees conferred by the University System will reach 27,539. These totals include bachelor's, 1st professional, master's, and doctoral degrees.

It is also predicted that in 1972-1973, United States institutions of higher learning will graduate 1,251,500; the total graduates in 1979-1980 will number 1,744,100.⁴ All the figures have been projected from population studies after the 1970 census.

GROWTH IN OCCUPATIONS

In Georgia the broad occupational makeup is expected to change by 1975. The basic pattern in Georgia will be similar to that of the nation as a whole. White collar workers will increase to 47 percent in 1980. Farm workers will decrease to only 2 percent. Blue collar and service workers are expected to maintain relatively the same proportion of the labor force in Georgia: 36 and 15 percent respectively.⁵

Professional, technical, and kindred workers will represent the fastest growing occupation group in Georgia from 1968-1980 - by 61 percent, making up 14 percent of the labor force.

Managers, officials, and proprietors are expected to increase by 37 percent - a rate that is significantly higher than the comparable national rate.

Sales workers will hold at 6 percent of the job market following closely the trends in retail sales.

Farm managers and farm workers will be affected by automation. They will continue to decrease by 50 percent from 1968 to 1980. Refer to Table 1A and 1B.

³U.S. Department of Commerce, Bureau of the Census, "Projections of School and College Enrollment: 1971 to 2000." *Current Population Reports*. Series P-25, No. 473. (Washington: U.S. Government Printing Office, January, 1972) pp. 3, 11, 13.

⁴U.S. Department of Health, Education, and Welfare, Office of Education, *Projections of Educational Statistics to 1980-81*. Publications No. (OE) 72-99. (Washington: U.S. Government Printing Office, 1971.) p. 42.

⁵*Georgia, Jobs for the Future*, op. cit., p. 32.

On the national scene, the rapid growth in requirements for white collar occupations will continue, faster than the average growth among blue collar workers, slower than the average growth among service workers; farm workers will decline even further.⁶

"The professional and technical occupation group, whose growth rate has outpaced that of all major occupational groups in recent decades, will continue to lead from 1968-1980; its estimated rate of increase is 50 percent, compared with 25 percent for all occupations. Service workers, who will increase nearly 40 percent, will be the second fastest growing group. Clerical workers, whose projected growth rate is 35 percent, will be the third fastest growing occupation. They will be followed by sales workers, managers, officials, and proprietors (22 percent); and operatives (10 percent) are projected to grow less rapidly than total employment. The employment level of non-farm laborers is expected to be about the same in 1980 as in 1968."⁷

⁶Occupational Manpower and Training Needs, op. cit., p. 8.

⁷Ibid. pp. 8-11.

SELECTED OCCUPATIONS

Methodology and Appendix 1 provide detailed information concerning the selection of 64 occupations considered in this study. The selection of these 64 is based on educational requirements of a college degree as outlined by the U. S. Department of Labor for these particular occupations.⁸

The following discussion highlights projections for many of the major occupations in the United States:

Professional and Technical Workers. Employment requirements for professional and technical workers in 1980 are projected at 15.5 million or 50 percent more than the 10.3 million in 1968. The demand for goods and services will be a major factor underlying increasing requirements for these highly specialized workers. Concentration of the population in metropolitan areas will create new demands on their services. Further efforts to develop the nation's resources and industry and the quest for knowledge will also require additions in this field.

Manpower needs will increase in almost every professional and technical occupation; rates of increase will differ among occupations. Table II outlines the differing rates of growth for 64 occupations on the national level.

Teaching. The largest profession is expected to require 2.7 million teachers by 1980 compared with 2.6 million in 1970. Rates of increase among the three major levels of teaching -- elementary, secondary, and college -- will vary greatly. A growth of 1 percent is expected for elementary school teachers. The 5 percent increase in requirements for secondary school teachers is primarily attributable to higher enrollments in secondary schools to 1980.⁹

The demand for college and university teachers is expected to grow almost 18 percent as the number of 18-21 year olds rises nearly 2.2 million between 1970 and 1980.¹⁰

Physical Scientists. Physicists are projected to grow from 48,000 in 1970 to 75,000 in 1980 -- a 56 percent increase. During the same period chemists are expected to reach 200,000 an increase of 63,000 or 66 percent. Increases in requirements in each of the above fields are heavily dependent on projected increasing expenditures for research and development.

⁸Donald Dillon, "Toward Matching Personal and Job Characteristics," *Occupational Outlook Quarterly*, Vol. 15, No. 4, Winter 1971, p. 11-23.

⁹*Occupational Manpower and Training Needs*, op.cit. p. 11.

¹⁰U.S. Department of Commerce, Bureau of the Census, "Projections of the Population of the United States, by Age and Sex: 1970 to 2020," *Current Population Reports*, Series P-25, No. 470. Nov. 1971, p. 31,32.

The projected increases for life scientists, including botanists, zoologists, and microbiologists will not be as dramatic. By 1980 there will be 60,000 more life scientists than in 1970 — 240,000 altogether. Growth in this occupation is related to the expanding research in health and environmental quality control.

Medical lab workers are expected to be in great demand by 1980. An increase of 73 percent is envisioned in the ten year period — from 110,000 to 190,000.

Business. Accountants, one of the largest occupations for men, will continue to increase. By 1980 there is a ten year increase expected of 229,000 or 47 percent, bringing their total to 720,000.

Systems analysts win the prize of the greatest percentage increase in the 70's — 183 percent. Where as in 1970 there were estimated 100,000 systems analysts, by 1980 there will be 283,000. Their increase will parallel the increased use of electronic data processing systems by business, government, universities, and other organizations.

Salaried managers are expected to grow very rapidly as business and government depend increasingly on trained management specialists in the 70's. A rapid growth of 44 percent is projected for manufacturer's salesmen — a 225,000 increase to 735,000 in 1980. Insurance agents and underwriters are expected to increase by 38 percent, or 154,000 to 558,000 by 1980.

The 64 selected occupations taken together are seen increasing over 21 percent in the 70's. However, if teachers were exempted in our computations, the percentage increase of occupations would be 29 percent for the ten year period.

TABLE II
JOB OUTLOOK IN U. S. TO 1980

Occupations	Estimated Employment 1970 ^a	Projected Requirement 1980 ^b	Percent Change 70-80	Average Annual Openings 1970-80			Employment Prospects
				Total	Employment Change	Replacement Needs	
Agriculture							
Agricultural Engineers	12,000	14,500	11.53	600	150	450	"Rapid increase due to mechanization"

^a Percent Change without Teachers is equal to 29.02

SELECTED OCCUPATIONS IN GEORGIA

The following analysis of the selected occupational groups will highlight the major developments in Georgia over the period 1970-1980. We have attempted to interpolate and extrapolate our data for the State of Georgia during the same period as was done for the U.S. occupational groups. In this way we would hope to facilitate comparison of Georgia's occupational growth with that of the nation. Throughout the entire study, all data on occupations in Georgia have been interpolated from Georgia Jobs For the Future, Georgia Department of Labor. Refer to Table III as well as Appendices 6 and 7 of this study.

For the state of Georgia all occupations are projected to increase from 1,841,250 in 1970 to 2,287,350 in 1980 or 24.2 percent. Professional Technical and Kindred workers are expected to rise from 216,410 to 315,820, an increase of 45.9 percent, in the same ten year period. This increase is close to the increase of all the selected occupations of this study for Georgia. The increase for the 64 selected occupations of this study was 42.6 percent from 1970 to 1980.

Agricultural Scientists. The agricultural scientists are projected to increase from 1350 to 1950 in the ten year period — a 44.4 percent increase. No doubt this increase reflects the fact that as agriculture becomes more and more automated, the demand for the trained person will be more acute. However, the overall number of workers on farms will decrease from 1970 to 1980 by 34,550 if existing economic and social conditions prevail to 1980. The percentage of decrease is expected to be 45 percent from 76,600 to 42,000, a noteworthy statistic for the University and especially the College of Agriculture.¹¹

Physical Scientists. Physicists are seen to increase by 800 in the 70's to 1540 — the greatest increase of all Georgia occupations studied. Chemists are also projected for a healthy increase of 1810 in the ten year period to 4,345 — a 71.4 percent rise. Mathematicians are expected to increase from 800 to 1200 for 1970-1980. Psychologists can be seen to increase from 585 to 975 — a 67 percent increase. Biological scientists are projected to increase from 850 to 1470 by 1980 — a 73 percent change.

Teaching. The demand for teachers in Georgia will continue to rise by 39.7 percent. 60,130 teachers in 1970 is seen increasing to 84,010 by 1980. The demands will vary in the different groups of teachers. For instance college teachers are expected to increase by 40.5 percent or 3600. Secondary school people are envisioned to have the greatest gain — 10,650 or

¹¹ Georgia Jobs for the Future, op. cit. p. 33-36.

51.7 percent in the ten year period. Elementary school teachers are projected to increase by 7,050 from 1970 to 1980 — a 29.3 increase. These projected increases seem to belie the experience of many young teachers seeking employment. But as Mr. Lawrence Bixby of the University of Georgia Placement Center contends, there are many positions in teaching (primary and secondary) to be filled in small cities and communities of the State.

Business. Accountants and auditors are expected to increase by 4750 to 17,115 by 1980 — a ten year increase of 38 percent. Personnel and labor relations workers have a projected increase of 1550 to 4745, a 48.5 percent rise. Economists have a healthy projected increase of 66.7 percent, though this represents 360 positions or a total of 900 by 1980. Similarly creditmen are seen to increase by 54.8 percent to 2600 — an increase of 920 positions in ten years.

The increase in insurance agents and real estate agents is relatively close to 45 percent and 48 percent respectively. In the former, 45 percent represents an increase of 8,120 to 26,020. In the latter 48 percent represents an increase of 1,120 to 3,460, in both cases to 1980.

Other Groups. In the state, managers, officials, and proprietors are expected to rise from 179,900 to 232,000 in the ten year period — nearly 29 percent. Sales workers will rise from 115,400 to 150,300 — a 30.2 percent increase in the 70's. These broad groups are not given in Table III.

Positions in social work are expected to rise by 41.9 percent between 1970 to 1980 — representing an increase of 1260 to 4270.

JOBS PER GRADUATE IN GEORGIA AND IN THE U.S. TO 1980

After reviewing the varying growths in occupations in the State and in the Nation, the average job market for college and university graduates during the 70's will be discussed. The reader will recall that our graduates include bachelors, masters, doctorate, and professional degree winners. In Table IV, average annual job openings in Georgia have been computed and compared with the average annual number of graduates of the University of Georgia System. This comparison has produced an average opening per graduate for each of the selected occupations in the 70's. The same has been done on the national level producing the average annual openings per graduate in the Nation.

TABLE IV

SUMMARY OUTLOOKS

Table V is our attempt to summarize the job outlook for the graduates in Georgia and for the U.S. graduates. If there were projected one or more jobs per graduate annually in any individual occupation, this situation was judged to be "very good." If our projections indicated .75 to 1 job per graduate annually, it was felt to be "good." If projected averages for an occupation were between .50 and .75 job per graduate annually, this situation was characterized as "fair." Projections less than "fair" were seen to be "difficult." Some selected occupations with projections on the national level did not lend themselves to Georgia projections. These were included in a category of "no direct data" on the state level.

It is the contention of the Project Team that up-to-date and bi-annual totals as presented in Tables IV and V are essential to the University information system. Information regarding the occupational needs of the State and the Nation must be current not only for the planning, programming, and budgeting system of the University but also for the meaningful counseling of students and planning at the department and school level.

TABLE V
AVERAGE JOB OUTLOOK 1973-1980

UNITED STATES				GEORGIA		GOOD & VERY GOOD

^a Insurance & Real Estate V. G.: Non-college graduates are also eligible making the ratings inflated.

^b Interpolated from Table IX percent of graduates going into fields.

^c Does not include Masters Level College Teachers.

^d Ratings in some occupations in the Natural Sciences may be low because bachelor's graduates are included.

GEORGIA'S SHARE IN THE OCCUPATIONAL OPENINGS OF THE NATION

In Table VI, the writers have attempted to answer the question: "What slice of the national 'pie' is Georgia getting?" They have attempted to demonstrate this by comparing Georgia's average annual openings and the U.S. average annual openings. The result has been a percent of Georgia share of the national occupations.

It can be noted that the average annual openings in Georgia of all workers versus the same figure for the Nation show Georgia receiving an average of 2.79 percent of all jobs in the Nation. A comparison of the job openings annually in the State and the Nation in professional, technical, and kindred workers shows Georgia's share to be 2.30 percent.

In the 1970's Georgia will have about 2.27 percent of the Nation's population.¹² Each occupation of individual interest may be compared with the 2.30 percentage to see whether Georgia is getting its fair share of the Nation's jobs.

¹² U.S. Department of Commerce, Bureau of the Census. "Preliminary Projections of the Population of States: 1975 to 1990." Current Population Reports. Series P-25, No. 477, March 1972, p 4.

UNIVERSITY OF GEORGIA'S SHARE OF GEORGIA'S GRADUATES

Table VII is an attempt to point out the built-in competition the graduates of the University of Georgia must face within the State from other University System degree winners. From 1972 to 1980 the average number of graduates for the University will be about 8,134. The average number of degree winners in the University System of Georgia for the same period will be 22,368. The University's share of the degrees won in the State will be 36.36 percent. All occupational categories of graduates may be compared to this figure. A study of these statistics by any graduate may convince him that he must have a broader and more flexible view of his position in the State job market.

MANPOWER NEEDS AND GRADUATES

Table VIII is an attempt to add specificity to this study in a way that may be easily examined by anyone interested in the graduates of the University of Georgia with planning and programming in mind. A break-down of the projections of Appendices 2, 3, 4, 5, and 6 is given below.

It will be noted that the selected occupations corresponding to an individual school in the University can be compared "across the board" in the following way: Openings in the State of Georgia versus Graduates of the University System versus Graduates of the University of Georgia versus Openings in the United States versus Graduates in the United States. These comparisons have been made for the years 1972-1980. The reader will note that the openings in Georgia and in the United States are constant throughout the eight year period. Table VIII presents "Average Annual Openings" for these two categories as researched in the manpower literature.

UNDERGRADUATE MAJOR 1960-1970 VERSUS FULLTIME EMPLOYMENT

It is the contention of the Project Team that although it has assigned various major fields in the University to singular and specific occupations, it is aware that every profession includes people from a variety of backgrounds. The research has shown that the above is true; there is, however, a close correspondence between major-studied and occupation in many fields.

The National Opinion Research Center in its 1964 study of student patterns concluded that field switches between college majors and jobs do occur but this is more the exception than the rule.¹³

Dr. Laure M. Sharp has demonstrated the conclusions in a table of broad occupational groupings. The table is included as Appendix 9 of this study. Following his lead we have taken the responses of 470 undergraduate majors of 1960 to 1970 randomly selected from the Alumni files of the University of Georgia.¹⁴ The majors of these graduates were compared with their full time employment in 1971-1972 in Table IX. Although Table IX is crude and the broad occupational groupings include jobs at many levels, the Table does convey some notion of how graduates sort themselves out along occupational lines with respect to the undergraduate field. Where the undergraduate major implies a relatively specialized training such as in business or in education, the full time employment percentages in the respective field are relatively high; in the case of education majors, 65 percent were employed as teachers; 58 percent of the business majors were employed in business and managerial positions.

According to Sharp (p. 11), an important consequence of taking a job unrelated to one's training has to do with the kind of job this will be. It is likely to be a nonprofessional job rather than a job in another profession. It is especially noteworthy to look at the social science majors: a relatively large proportion were employed in business and in professionally marginal jobs.¹⁵ Data on graduates of the University of Georgia, 1960-1970 in the social sciences favor this view. We find that 47 percent of the undergraduate majors in the fields of political science, psychology and sociology were employed in business, managerial and sales occupations.

¹³Laure M. Sharp, Education and Employment, (Baltimore: The Johns Hopkins Press, 1970). p. 7.

¹⁴Lin Tisdell and others, Measuring One University Output: A Survey of Undergraduate Degree Holders From the University of Georgia From the Classes of 1960-1970. Office of Program, Planning and Analysis, University of Georgia (Athens: University of Georgia.) pp. 3-4.

¹⁵Sharp, op. cit. p. 11.

While business may actually be a satisfactory or deliberately chosen occupation, evidence from other studies suggests that a business career is a reluctant choice for many students who were not business or economics majors.¹⁶

¹⁶ Ibid. p 12.

OCCUPATIONAL SUGGESTIONS

In its projection to 1980, the Project Team has been unable to give relevant data on degree winners in the Liberal Arts. Yet from past experience almost 5 percent of the University's graduates have majored in Foreign Languages, English, English Literature, Classics, Speech, etc.

A summary of recent U.S. Labor Department literature¹⁷ offers occupational suggestions directly applicable to liberal arts majors. There is a wide variety of employment available in both the public and private sectors. However, the liberal arts student should develop career goals as early as possible. He need not necessarily specialize in one occupational area; he should know his vocational interest and talents and realistically evaluate his chances for obtaining a job in the field of his interests. The liberal arts student should be aware that employers, especially those hiring for nontechnical jobs, look closely at extracurricular activities, leadership roles, interests and abilities.

The following is a group of occupational areas which are generally open to liberal arts graduates. For most of the jobs, a pleasing personality, a broad education and ability to learn are more important than any specific academic preparation.

Administration: Liberal arts graduates who wish to enter administrative work may find positions as administrative assistants, workers who help executives by coordinating and directing office programs, records control or budget preparation and control.

Advertising: Various types of jobs are available in advertising: advertising copywriters, media directors, production managers, research directors, artists and layout men, art buyers, account executives or advertising managers.

Art -- related jobs: Museums and art galleries have a limited number of positions for those who can combine a bachelor's degree with artistic interests.

Banking: A wide range of positions is available in banking. Many large city banks have well-organized officer training programs open to liberal arts graduates. Some of these positions include loan officers, trust officers, branch bank managers, correspondent bank officers or international officers.

Book Publishing: In general, entry-level jobs are either in the editorial or sales departments of publishing houses; jobs in sales outnumber those in editorial work.

¹⁷ Gloria Stevenson, "Putting a Bachelor of Arts Degree to Work," *Occupational Outlook Quarterly*, Vol. 15, No. 4, Winter 1971. pp. 3-12.

Computer Programming: Some organizations hire liberal arts graduates for training courses in computer programming. Employers look for trainees having the aptitude for logical thinking and exacting analysis.

Industrial Traffic Management: First jobs are often in shipping rooms or in general traffic offices. Experience in these offices leads to more technical work such as analyzing transportation costs.

Insurance: Before new agents sell, they usually receive a few weeks or months of training at insurance company home offices or at the agencies and brokerage firms where they will be working.

Magazine Publishing: Entry-level positions existing on larger and better known magazines are for editorial secretary, editorial assistant and editorial researcher. Jobs with trade magazines are more numerous and competition is less fierce.

Newspaper Reporting: Many beginners work on weekly or small daily newspapers where they are hired as general reporters. Others start on large city papers as reporter trainees or copy boys or girls.

Personnel Administration: Recruiters for these jobs look for graduates who have a better-than-average ability to work with people and who can also speak and write effectively.

Public Relations: Specific duties may include writing pamphlets or newspaper and magazine articles, participating in community affairs, planning conventions, writing speeches for company officials, or arranging events designed to spark favorable publicity. All types of organization are included.

Purchasing: The beginner in the purchasing field must spend considerable time learning about his employer's operations and purchasing procedures. Following the initial training period, the trainee may become a junior buyer of standard catalog items.

Sales: Manufacturers sales representatives sell mainly to other businesses; securities salesmen furnish customers with information about the advantages and disadvantages of various types of investments.

Government: Many liberal arts graduates work for state, local and federal government agencies. Occupational fields frequently include personnel administration, program administrators, computer programming, writing and editing, social work, research, planning, banking, and investigatory, and regulatory work.

This list does not include *all* opportunities open to liberal arts graduates but offers a summary of interesting and promising fields. Detailed information can be found in the 1970-71 editions of the Occupational Outlook Handbook and the Occupational Outlook for College Graduates.

METHODOLOGY

In an effort to produce a viable and meaningful manpower study for the University of Georgia, the Project Team has followed one overriding policy: Base all decisions and projections on the most recent data and recognized authority. The Project Team will attempt to demonstrate this policy in the description of methodology to follow:

Three major critical decision-areas of this study:

1. Occupations relevant to University of Georgia graduates and selected for this study.
2. Major fields in the University and their relationship to the selected occupations.
3. Data series projected to 1980.
 - A. Estimated graduates:
 - (1) University of Georgia.
 - (2) University System of Georgia.
 - (3) Aggregate United States.
 - B. Estimated employment:
 - (1) State of Georgia.
 - (2) United States.

1. U.S. Labor Department in its Occupational Outlook Quarterly, Winter 1971, had determined 91 occupations that require a bachelor's degree, graduate work or first professional degree. These 91 occupations were the basis for selecting the final 64 occupations considered in this report. A few occupations requiring college work but not a bachelor's degree were selected because they corresponded directly to major fields at the University of Georgia. Examples of these were insurance agents, real estate agents, or medical lab workers.

2. The Higher Education General Information Survey (HEGIS) reports for the years 1967-1968, 1968-1969, 1969-1970, 1970-1971, 1971-1972 were studied to determine the major fields of University of Georgia graduates. The Project Team then matched these major fields with the occupations selected for the study. When questions arose as to the correspondence of the major field to a selected occupation, the "training and qualifications" section of the Occupational Outlook Handbook 1972-1973 and the draft, Handbook for Projecting Employment by Occupation for States and Major Areas, 1970 were researched. In some cases,

academic advisors were consulted as to the correspondence of a major field and a selected occupation. Winners of bachelors, masters, doctorate, and professional degrees were classified together in selected occupations unless otherwise specified. Refer to Appendix I.

3. In general, data series projections for graduates to 1980 were obtained by means of a regression equation.¹⁸ The particular equation used was:

$$\hat{Y} = b_1 x_1 + b_0$$
$$\text{where } b_1 = \frac{N \sum xy - \sum x \sum y}{N \sum x^2 - (\sum x)^2}$$
$$b_0 = \bar{y} - b_1 \bar{x}$$

A. Estimated Graduates:

(1) University of Georgia Graduates.

In particular, University of Georgia graduates for the calendar years 1965 to 1972 were compared with U.S. college enrollment figures for the calendar years 1965 to 1972. The University of Georgia figures were obtained from the Fact Book, 1971, University of Georgia and from data obtained from the Registrar's Office of the University of Georgia on the number of University graduates in 1972.

Data concerning enrollment in the United States were obtained from "Current Population Reports", January, 1972¹⁹ Information in this same publication projected the U.S. enrollment to 1980. Series C2 was selected since it reflected a moderate increase in enrollment and seemed to fit best the information available on college enrollment to 1980.²⁰ The above cited regression method was used to determine the projected total number of graduates per year to 1980. Refer to Appendix 3.

¹⁸ Gene Guss and Julian Stanley, Statistical Methods in Educational Psychology, (Englewood Cliffs, N.J.: Prentice Hall, Inc., 1970.) p. 137.

¹⁹ "Projections of School and College Enrollment: 1971-2000." Series P-25, No. 473, op. cit. p. 25.

²⁰ Western Interstate Commission for Higher Education, "Western College Vacancies Zoom, Applications Off: WICHE Survey." Reports on Higher Education, Vol. XVIII, June-July, 1972. No. 243, p. 1,2.

The University of Georgia HEGIS (Higher Education General Information Survey) reports were studied for the years 1967-68, 1968-69, 1969-70, 1970-71, 1971-72 to obtain the number of graduates per year in each occupation. The percent of the total graduates for the five year period was calculated in each occupation. For example, during the years 1967-72, 2.149 percent of the graduates of the University of Georgia majored in chemistry, 2.833 percent majored in accounting, etc. With the data, estimated University of Georgia graduates in each occupation were generated from 1973 to 1980. Refer to Table VIII or Appendix 3.

(2) University System of Georgia Graduates.

The total number of graduates for the University System of Georgia was calculated in a similar fashion. The total graduates in the University System were compared with the graduates in the United States for the fiscal years, 1964 to 1971. University Systems graduates data were obtained from the published Annual Report University System of Georgia.

Data concerning graduates of the United States for the fiscal years 1964 to 1971 were obtained from the Department of Health, Education, and Welfare document Projections of Educational Statistics to 1980-81.²¹ The same publication projected United States graduates to 1980. The regression method cited above was used to determine the projected total number of graduates per year to 1980. Refer to Appendix 4.

Reports to the State of Georgia Board of Regents were obtained directly from the Board of Regents for the years 1968-69, 1969-70, 1970-71. The reports provided detailed information on the major fields of graduates in the University System. The percent of the total graduates for the three year period was calculated in each occupation. The University System graduates in each occupation were projected from 1972-1980. Refer to Table VIII or Appendix 3.

(3) Aggregate United States Graduates.

The projected aggregate of graduates in the United States for the fiscal years 1972 to 1980 was obtained from Projections of Educational Statistics to

²¹Projections of Educational Statistics to 1980-81, No. (OE) 72-99, op.cit., p. 43.

1980-81.²² Data on graduates in the individual occupations were obtained from the Department of Health, Education, and Welfare publications, Earned Degrees Conferred, 1967-68, 1968-69, 1969-70. These three publications are the most recent, containing the specific information needed for this study. The percent of the total graduates for the three fiscal years was again calculated in each occupation. The aggregate of U.S. graduates in each occupation was projected from 1972 to 1980. Refer to Table VIII or Appendix 6.

B. Estimated employment:

(1) State of Georgia.

All projections concerning the estimated employment in the State of Georgia were developed and generated from the recent publication of the Georgia Department of Labor, Georgia: Jobs for the Future, 1971. The first step in the process of our projections was to mesh the selected occupations of this study with the occupations studied in the Georgia Department of Labor report. The correspondence was not seen to be a direct one in all cases. The endeavor has been facilitated through the cooperation of Maria M. Mallet, Chief, Manpower Resources, State of Georgia. Ms. Mallet provided her own views on how we could mesh the occupation titles of the Bureau of Labor Statistics with the occupation titles of the Georgia publication. She also suggested two documents for our research -- The U.S. Labor Department Draft Publication, Handbook for Projecting Employment by Occupation for States and Major Areas and Conversion Table; Bureau of the Census -- Dictionary of Occupational Titles, 1970. Many of the questions of the Project Team were answered by researching these documents. Refer to Appendices I and II.

The derivation of the projection in each Georgia occupation was developed in the following manner: In the publication Georgia, Jobs for the Future there are tables indicating "Expansion and Replacement Needs by Occupation in Georgia from 1967-1975." Refer to Appendix 8. "Expansion Needs," "Replacement Needs" and "Total Demand" of employees are projected for the years 1967-1975. The Project Team postulated that the assumptions on which these projections were developed would hold true to 1980. In fact, the Georgia study states: "The

²² Ibid., p 43.

manpower forecasts in the Georgia study have been made within the framework of the assumptions underlying the national manpower projection to 1980.²³ Thus, the average annual openings 1970-1980 in Georgia (Table III) were generated by dividing the 1967-75 projections by eight, producing average *annual* openings. In developing Table III, the Project Team followed the form of the Bureau of Labor Statistics publication *Occupational Manpower and Training Needs*.²⁴

Having determined the average annual expansion needs and knowing the estimated employment in the State of Georgia for 1975 from the same Georgia Labor Department document, the writers generated the yearly total employment in each occupation by adding the average annual expansion need five times to get to 1980 and subtracting the same figure over and over again to get back to 1970. Refer to Appendix 5.

(2) United States.

The main sources in the generation of the working tables in this case were the two Bureau of Labor Statistics publications: *Occupational Outlook Quarterly*, Spring, 1972, and *Occupational Manpower and Training Needs*, 1971. From the former document the Project Team obtained the "Estimated employment in the U.S. 1970." In the latter document the projected requirements for 1980 were obtained. The difference in the totals indicated the "Employment change in the U.S." for the ten year period. With this figure the average *annual* employment change was calculated. By adding this annual figure to the 1970 estimated employment figure over and over again, ten times, the writers determined each occupation for each year of the 70's. Refer to Appendix 5.

In Table II, the average annual openings 1970-1980 have been included. Again the general form of the Tables in the publication, *Occupational Manpower and Training Needs*, 1971, was used.²⁴

Having obtained the total average annual openings 1970-1980 from the *Occupational Outlook Quarterly*, Spring 1972, for each occupation and having calculated the average annual employment change 1970-1980, the writers determined the average annual replacement needs for the ten year period by a subtraction process.

²³ *Georgia Jobs for the Future*, op. cit. p. 3.

²⁴ *Occupational Manpower and Training Needs*, op. cit. pp. 67-74.

CONCLUSION

Having followed the methodology outlined in the last section of the study and based on most recent available statistics, we have brought together the highlights of the growth in the number of graduates and occupations, concentrating on Georgia and relating to the nation as a whole.

It must be emphasized again that the outlook, the indicated manpower needs of University graduates and the tangent suggestions have been extrapolated from present available information. Tomorrow's changes can change the scenario.

Clark Kerr in concluding his "point" on "Policy Concerns of the Future" as a result of the Carnegie Commission made a remark appropriate also to conclude this study: "Predictions and prescriptives are much easier to make when we have fairly clear trends and definite information about what affects those trends. In higher education, the many uncertainties make predictions hazardous at the present time."²⁵

Air conditioning, refrigeration & heating mechanics	700	290	990
Airplane mechanics and repairmen	600	480	1,080
Motor vehicle mechanics	2,840	2,120	4,960
Office machine mechanics	820	250	1,070
Radio and T.V. mechanics	420	230	650
Railroad and car ship mechanics	110	170	280
Other mechanics and repairmen	11,050	5,510	16,560
Printing trades craftsmen	840	600	1,440
Compositors and typesetters	-20	390	370
Electrotypers and stereotypes	-30	20	0
Engravers except photoengravers	50	20	70
Photo-engravers, lithographers	570	300	870
Pressmen and plate printers	450	170	620
Transportation, and public utility craftsmen	2,690	1,020	3,710
Linemen and servicemen	3,190	670	3,860
Locomotive engineers	-120	320	200
Locomotive firemen	-360	90	-270
Other craftsmen and kindred workers	8,690	4,810	13,500
Bakers	240	590	830
Cabinetmakers	250	350	600
Carpenters, dockworkers, busmen	830	950	1,780
Glaziers	250	50	300
Jewelers and watchmakers	-50	150	100
Loomfixers	170	400	570
Opticians, lens grinders, polishers	30	40	70
Inspectors, log and lumber	190	140	330
Inspectors, other	810	470	1,280
Upholsterers	380	220	600
Craftsmen and kindred, n.e.c.	5,300	2,050	7,350
Operatives and Kindred Workers	45,600	72,890	118,490
Drivers and deliverymen	19,990	6,980	26,970
Drivers, bus, truck, tractor	14,360	5,090	19,450
Deliverymen, routemen, cab drivers	5,540	1,890	7,430
Semiskilled metalworkers	2,680	2,640	5,320
Assemblers, metalworking, Class A	60	150	210
Assemblers, metalworking, Class B	90	1,010	1,100
Inspectors, metalworking, Class B	100	110	210
Machine tool operators, Class B	-400	600	0
Electroplaters	20	20	40
Electroplater helpers	10	30	40
Furnacemen, smeltermen, pourers	100	60	160
Heaters, metal	20	10	30
Welders, flamecutters	2,480	830	3,310

APPENDIX B Continued. EXPANSION AND REPLACEMENT NEEDS
BY OCCUPATION IN GEORGIA FROM
1967 - 1975

Occupation	Expansion Needs 1967-1975	Replacement Needs 1967-1975	Total Demand 1967-1975
Transportation and public utility operators	20	640	660
Busmen, taximen	-220	290	70
Pictorial operators	100	90	250
Sailors and deckhands	80	60	100
Semiskilled trade occupations	-1,750	13,020	11,270
Electricians, hangers, riggers	-20	1,680	1,660
Spotters, riggers	-2,000	1,000	-1,000
Refrigerators, riggers	-2,100	1,200	-900
Seamers and stitchers, manufacturing	2,620	14,980	17,600
Other operators and kindred	24,950	43,550	68,500
Architects, construction workers	100	60	170
Attendants, auto service, parking	3,200	1,000	4,200
Blaunders and powdermen	90	10	40
Laundry, dry cleaning operators	700	3,600	4,300
Wine operators, laborers, n.e.c.	100	200	300
Wine carriers, except meat packing	500	700	1,200
Operators and kindred, n.e.c.	20,170	37,090	58,060
Service Workers	43,580	46,870	152,700
Private household workers	15,560	36,620	54,580
Protective service	2,150	3,320	6,070
Firemen	900	670	1,090
Police, other law enforcement officers	920	750	1,670
Guards, watchmen, doormen	670	2,500	3,370
Food service workers	14,600	13,980	27,790
Bartenders	1,000	750	1,750
Cooks except private household	4,970	4,720	9,690
Caterers, banquet workers	2,200	1,560	3,760
Waiters, waitresses	6,230	6,540	12,550
Other service workers	10,820	12,440	43,260
Airline stewards, stewardesses	800	550	1,350
Attendants, hospital and other institutions	5,710	4,600	10,320
Charwomen and cleaners	2,000	2,150	4,150
Janitors and seamen	5,780	6,450	12,230
Nurses, practical	1,900	3,380	5,280
Other service workers, n.e.c.	14,080	15,950	29,490
Laborers except Farm and Mine	2,480	12,710	15,990
Farmers and Farm Workers	-27,640	11,870	-15,770
